

1. For each type of element the user want, they select a few of those objects. The tool gets the HTML and XPath for each of those objects.

3. The prompt builder collects the information of the objects and the link to the website, and puts together a prompt which instructs the LMM to generate the scraper code.

4. The LLM generates a response from the prompt.

6. The generated scraper code script is run.

2. The browser tool gets the link to the website

5. A python script extracts the code from the prompt.

7. The final data file is sent to the user.
